

COMPUTATION III

S Y L L A B U S 2 0 2 3 - 2 0 2 4

INSTRUCTOR INFORMATION	JOÃO FONSECA jpfonseca@novaims.unl.pt joaopfonseca.github.io
	DAVIDE FARINATI dfarinati@novaims.unl.pt
	LIAH ROSENFELD
	lrosenfeld@novaims.unl.pt
SCHEDULE	TP1:
	• Monday 11:30h – 13:00h
	P1:
	• Thursday $14h - 15h30$
	• Friday 15h30 – 17h00
	P2:
	• Wednesday 14h – 15h30
	• Thursday 14h – 15h30
OFFICE HOURS	Wednesday 11:30h – 13:00h (schedule appointment by email)
	Room TBD
CONTACT	Students should use Moodle platform for any communication with
	the course instructors. Homework and project submissions should
DECOUDTION	also be done through Moodle.
DESCRIPTION	This course is designed to provide students with a solid understanding of object-oriented programming (OOP), covering essential concepts
	such as class and method definition, library utilization, and more,
	using the Python programming language. It is assumed that the
	students attended the programming courses taught during the first
	year of the underlying bachelor degree at NOVA IMS.
OBJECTIVES	At the end of the course, students should be able to:
	• Model a problem using the Unified Modeling Language
	(UML);
	• Set up and use an appropriate software development
	environment according to a project's needs;
	• Write and debug code based on OOP;
	 Write computer programs to solve specified problems;
	 Maintain, publish and document Python code;
COURSE SUCCESS	In this course, success depends on a number of factors:
	• A priori knowledge of Python programming;
	• Class attendance;

1 João Fonseca Computation III 2023/2024

 Work during the semester and not only when exams are about to start; Develop the course project during the semester, making th most of the practical classes; Complete exercises provided in class and consistent practi Read the suggested references and materials made availability by the lecturer. CONTENTS Introduction to the course Computation III (Syllabus, Objectives, Project, Grading and Bibliography) Re-introduction to operand programming (OOP) Introduction to object oriented programming (OOP) Introduction to software design Inheritance and polymorphism in OOP Introduction to versioning control system (VCS) with Git Branching, undoing and forking in VCS Examining and setting up Python libraries Software development strategies Creating computer games with PyGame BIBLIOGRAPHY

STUDENT EVALUATION 1st Call – 60% final exam, 40% practical group project	STUDENT EVALUATION	
2nd Call – 100% final exam		

Coursework

The project consists of the application of all contents discussed in the course. The students will develop a game using Python based on a set of specific guidelines. The guidelines provide the students with information on the type of tasks they should do and the general results they should achieve. The full description of the project guidelines, goals and requirements will be announced on lecture 6. The end product of the project should be your code, fully documented, and your project's UML diagram, published in an open-source repository. With this project, students are expected to develop their proficiency in Python programming, as well as understand software development best practices, documentation, maintenance and code distribution.

Project discussion: after submitting the projects, students will be called to discuss them with the instructors. Failing to attend the project discussion will result in a final grade of zero (to the individual student) in the group project.

Groups' composition: the project must be done as a group. The groups must have 3 students.

Project Deadline: December 20th (Tentative)

In-class behavior: Active and positive participation is an integral part of the learning experience and contributes significantly to both personal and group learning. As such, the teaching faculty reserves the right to apply penalties to the individual students' final grade for poor in-class behavior, at their discretion.

Tasks. In both practical and theoretical classes, students will be frequently assigned homework, which will consist of simple tasks related with the course material. It is expected that the students complete these tasks.

Final Exam (2nd call evaluation). The final exam will be a 1.5 hours in-class exam covering all the materials of the course.

Grading

1st Call Final exam: 60% Project: 40%

2nd Call Final exam: 100%

There are two opportunities to do the exam. Any delay in the delivery of the project is subject to a penalty of 10% of the grade for each day of delay. The project will be developed in groups, and each group must be composed of 3 elements. **To obtain approval in the course, the student cannot have less than 8 (40%) in the exam grade.**
