

DATA MINING

SYLLABUS
2020-2021

INSTRUCTOR INFORMATION	FERNANDO LUCAS BAÇÃO 2º floor, room 10 Tel: 21 3870413 (ext. 222) bacao@novaims.unl.pt http://www.novaims.unl.pt/fbacao JOÃO FONSECA jfonseca@novaims.unl.pt DAVID SILVA dsilva@novaims.unl.pt
SCHEDULE	MAA-DS Theoretical Sessions <ul style="list-style-type: none">• Mondays from 15h30 – 16h45 Practical Sessions (João Fonseca) <ul style="list-style-type: none">• P5 - Friday from 9h30 – 11h00• P6 - Friday from 11h00 – 12h30• P4 - Friday from 15h30 – 17h00 MAA-BA Theoretical Sessions <ul style="list-style-type: none">• Mondays from 11h00 – 12h15 Practical Sessions (David Silva) P1 - Monday from 14h00 – 15h30 P2 - Monday from 15h30 – 17h00 P3 - Monday from 14h00 – 15h30
OFFICE HOURS:	Mondays from 13h00 – 14h00 (schedule appointment by email), 2nd Floor, Room 10
CONTACT	The course has its own email address mdsaa2021@gmail.com , which should be used by the student to contact the teachers. To submit any homework and/or projects you must use Moodle.
DESCRIPTION	The Data Mining course aims to study the main methods and tools available in data mining (knowledge discovery in databases), more specifically the subset of tools which are usually called descriptive models (or unsupervised learning). The course does not assume familiarity of the student with the theme, but it is highly recommended that

the students have knowledge of inferential statistics, as well as minimal computer skills.

The course seeks to achieve a balance between courses dedicated to in-depth analysis of the algorithms and the courses for managers that seek to raise awareness about the importance of the tools. This is a technical course for all, those who already work or want to work in developing descriptive models and exploring big databases. As such, students will perform the activities of a typical data scientist, especially in the project work, which constitutes a central component of the course.

The main concern in this course is to present the algorithms in a clear and comprehensible way to a wide audience with different academic backgrounds. It is intended to enable the student to understand the fundamentals associated with the inner workings of the different algorithms, because only then the student will be able to apply them judiciously.

The course program covers the main methodological aspects, data preparation and preprocessing tasks as well as the most popular descriptive models, including different clustering algorithms and association rules, among others. The aim is also to provide students the opportunity to learn/use Python to implement and apply these algorithms in real world applications.

OBJECTIVES	<p>At the end of the course, students should be able to:</p> <ul style="list-style-type: none">• Discuss the most relevant ideas and concepts associated with data mining;• Understand the fundamentals of exploratory data analysis, including the use of graphics;• Be able to execute basic and intermediate data preparation and pre-processing tasks;• Describe Multidimensional Visualization Methods, such as such as principal components analysis, multidimensional scaling and self-organizing maps;• Describe with detail segmentation techniques such as cohort analysis and RFM analysis;• Describe with detail clustering techniques such as hierarchical clustering, partitioning methods, density-based methods and fuzzy clustering;• Understand the trade-offs involved in the definition of the number of clusters and how to interpret and analyze a clustering solution;
------------	---

	<ul style="list-style-type: none"> • Discuss the use of nearest neighbors and decision trees to explore and get insights on clustering solutions; • Create a segmentation, being able to explain the options used and explaining alternative approaches, whenever available; • Describe the <i>apriori</i> algorithm, as well as calculate and explain the most relevant performance measures of association rules;
COURSE SUCCESS	<p>In this course success depends on a number of factors:</p> <ul style="list-style-type: none"> • Basic knowledge of statistics; • Attend classes; • Work during the semester and not only when the exams are about to start; • Develop the course project during the semester, making the most of the practical classes; • Read the suggested references.

Course Projects

Project consists of a practical clustering application using Python. In this project the students will complete the segmentation of a customers database, following all the usual steps of a real world project. For this the students will receive a set of specific guidelines that they should follow. The guidelines provide information about the type of tasks the students should do and the general results they should achieve. The end product of the project should be a report about the database and the different customer segments of the company. With this project the students should develop their analytical skills, but also their proficiency in working with large datasets, extracting, transforming and loading tasks and visualization and reporting.

Project discussion: after submitting the projects the students will be called to discuss the project with one of the instructors.

Project groups: the project can be done individually or in groups (the latter is a better option) the groups should not exceed 3 students.

Project Deadline: January 4th

Tasks. In both, practical and theoretical classes, students will be frequently assigned homework, which will consist of simple tasks related with the course material. It is expected that the students complete these tasks.

Final Exam. The exam will be a single hour in-class exam covering all the material of the course. The exam will consist of 15 to 20 multiple-choice questions, 5 to 10 true or false questions and a small essay.

Grading

Project: 35%

Exam: 65%

Both components of the evaluation (project and exam) are mandatory. There are two opportunities to do the exam. Any delay in the delivery of the project is subject to a penalty of 10% of the grade for each day of delay. Please note that the project will be developed in groups, but each group cannot have more than 3 elements. To obtain approval in the discipline the student **cannot have less than 8 (40%) in the exam grade.**
